

# Examples of FM/TBM target analysis

Jimin Pei

# Summary

- Poor-quality regions: N- and C-terminal regions.
- Poor-quality regions: loops and regions near flexible segments.
- Group 427 has overall better quality than other methods for many FM targets.
- Group 427 fixed poor-quality regions by other programs.
- Group 427 underperformed in only a couple of targets (T1029 and T1047s2\_D3).

# Poor modeling quality at the N- and C- termini.

## Possible causes:

- They are more flexible.
- They tend to have problems with multiple alignments and contact predictions.
- Their conformations depend on interactions with other domains/chains.

T1070

# T1055 (DNA polymerase processivity factor from Vaccinia virus; NMR structure)

- N-terminal segment is more flexible and was not modeled right.
- FSKV formed a beta-bulge to bury F and V.
- 427 modeled it as a continuous helix, other methods modeled it as loops in different positions.

# T1031 N-terminus

T1031: first domain of virion-packaged DNA-dependent RNA polymerase of crAss-like phage phi14:2, X-ray resolution: 3.5Å

# T1031 N-terminus

- Group 427 modeled N-terminal loop with overall correct conformation.
- However, it is misaligned by three residues.
- Other top groups do not model the overall shape of the N-terminal loop as well as group 427.

Experimental: ---ACK**I**EN**I**KYKGKEVE  
Group 427: ACK**I**EN**I**KYK---GKEVE

Group 427 (magenta)

Groups 473, 335, 042

# Poor modeling quality in loops.

Example: T1038\_D2  
(TSWV glycoprotein; X-ray structure with resolution: 2.5Å)

T1038\_D2 loop region 230-238 has large B-factors in all three chains.

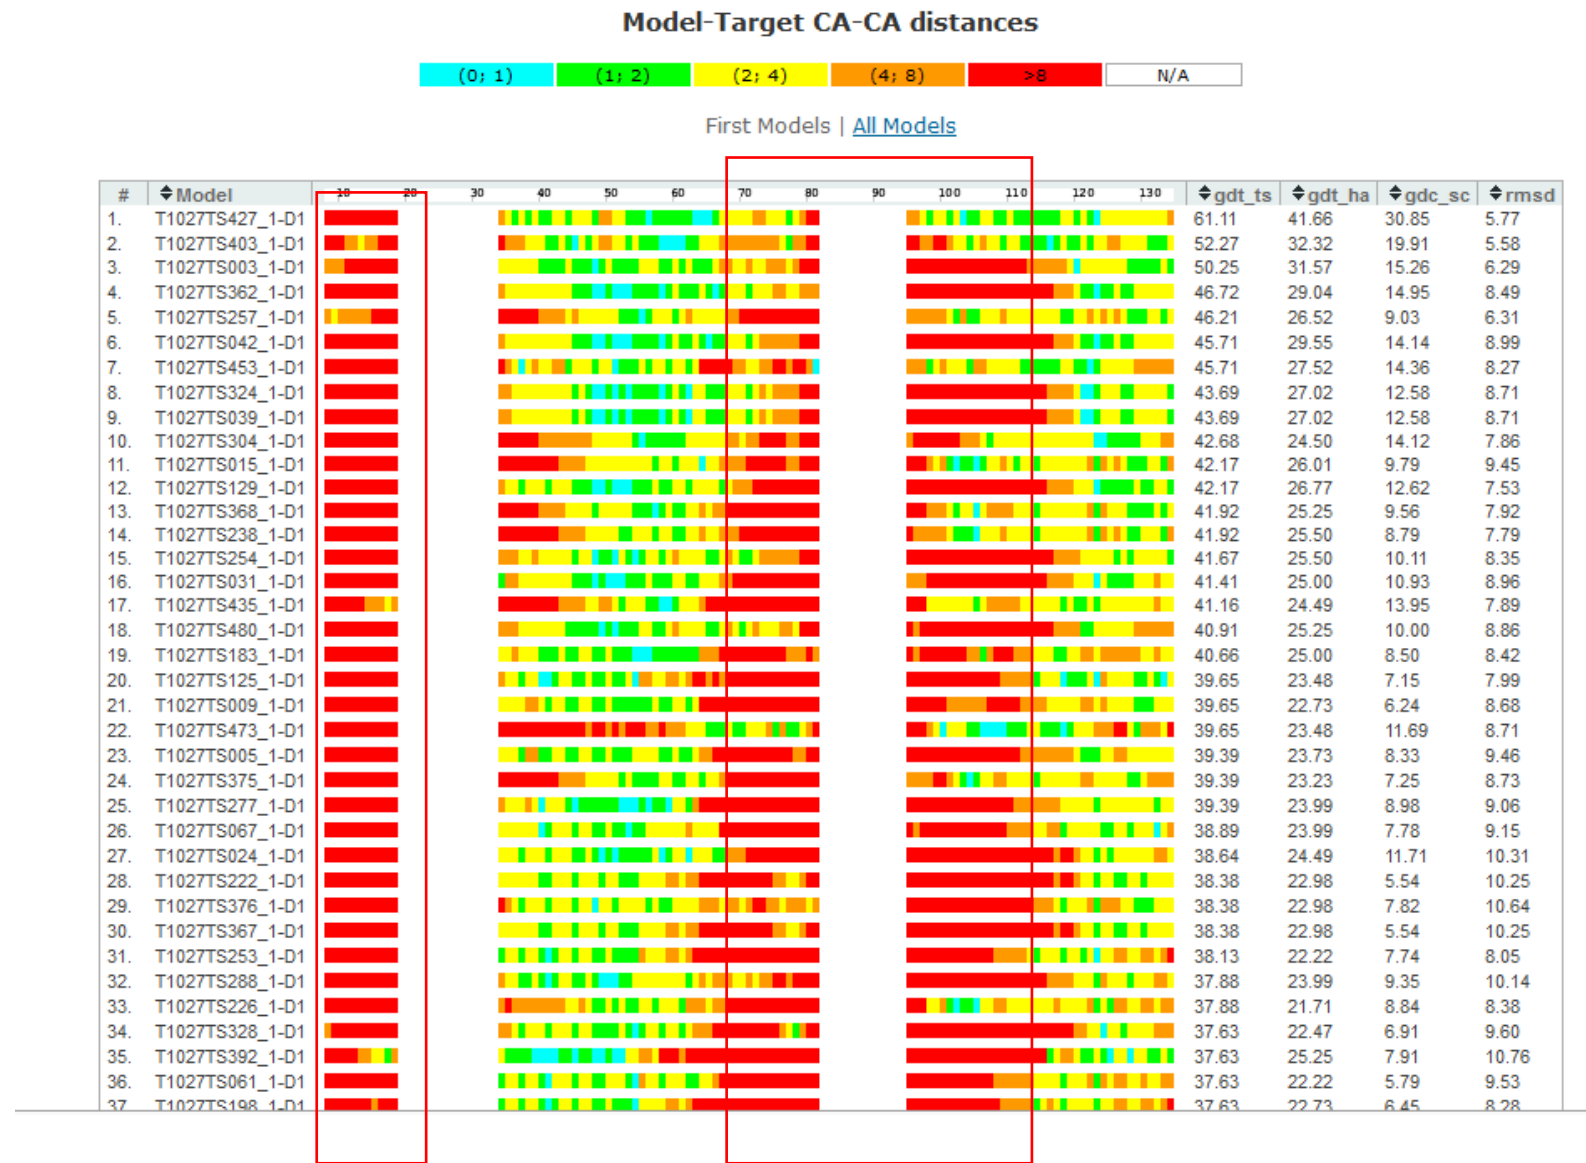

Three chains in experimental structure superimposed.

Group 427 model (magenta+cyan) aligned to experimental structure (green+yellow)

**Poor quality  
around flexible  
(disordered)  
regions.**

**Example: T1027 (Gaussia luciferase;  
NMR structure)**

# T1027 (Gaussia luciferase; NMR structure) – the N-terminal helix is modeled incorrectly by most programs.

- N-terminal helix (residues 8-18; **DFNIVAVASNF**) is made up of mainly hydrophobic residues.
- It is in the core of the real structure, surrounded by other helices.
- It has a parallel orientation to the second helix.
- However, most programs modeled it on the outside and forming a helix hairpin with the second helix.

Group 427

Experimental structure

# Group 427 just has overall better quality than other methods. Example – T1033

Group 427 GDT: 87.5

Group 473 GDT: 77.5

T1033 is the second domain from T1044 with resolution 3.5A

# T1046s1 – group 427 fixed the problem in a particular element.

- A  $\pi$ -helix conformation is present near the C-terminal end of the first helical segment.
- Group 427 modeled it correctly. Other groups modeled it as part of a regular alpha-helix.

Group 427 (yellow) to real structure (green) GDT-TS: 96.5

Group 473 (cyan) to real structure (green) GDT-TS: 81.4

Indication that a one-residue insertion in an alpha-helix is reflected in BLAST alignments of T0146's homologs.

FlgH-FlgI

T1047s2D3 – group 427 modeled disordered region as a beta-hairpin inserted in two strands that are neighbors in real structure.

Group 326

Experimental structure

Group 427

# Conclusions of manual analysis

- Poor modeling quality often occurs in N- and C-termini, loops and near flexible regions.
- Group 427 generates overall better quality models for FM and FM/TBM hard targets, some of which are very close to solving the protein folding problems (GDT-TS > 90).
- Group 427 is able to fix some low-quality regions by other methods.
- Group 427 underperformed in only a couple of targets (T1029 (NMR)) and T1047s2\_D3 (disordered region and oligomer)).
